MAIN FEATURES

Note: Survey estimates are subject to sampling variability, as explained under the heading 'Reliability of Estimates' below.

Comparing February 1982 with February 1981:

- * the estimated civilian population aged 15 years and over increased by 8 800 to 1 001 500.
- * the estimated labour force participation rate increased from 61.1 per cent to 61.6 per cent; for females aged 35 years and over the rate increased from 30.3 per cent to 33.2 per cent.
- * the estimated number employed increased by 5 500 to 565 700; the number of females aged 35 years and over with part-time jobs increased by 7 800 to 46 500.
- * the estimated unemployment rate increased from 7.6 per cent to 8.2 per cent; for married females the rate increased from 4.6 per cent to 6.0 per cent.
- * the estimated unemployment rate for persons born outside Australia increased from 8.1 per cent to 9.8 per cent; for females born outside Australia the increase was from 8.5 per cent to 11.8 per cent.

EXPLANATORY NOTES

INTRODUCTION

These estimates are derived from the monthly population survey which is carried out on a sample basis throughout Australia.

The survey is based on a multi-stage area sample of private dwellings (currently about 5 000 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.) and covers about one per cent of the population of South Australia. Information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the survey week).

SCOPE

The survey includes all persons aged fifteen years and over, except:

- (i) members of the permanent defence forces and of non-Australian defence forces (and their dependants) stationed in Australia;
- (ii) certain diplomatic personnel of overseas governments, customarily excluded from census and population estimates, and
- (iii) overseas visitors holidaying in Australia.

DEFINITIONS

The labour force category to which a person is assigned depends on his actual activity (i.e. whether working, looking for work, etc.) during the survey week. The definitions conform closely to the international standard definitions recommended by the International Labour Organization and relate only to those persons within the scope of the survey.

Employed persons comprise all those aged 15 years and over who, during the survey week:

- (i) worked for one hour or more for pay, profit, commission or payment in kind, in a job or business, or on a farm (including employees, employers and self-employed persons); or
- (ii) worked for 15 hours or more without pay in a family business or on a farm (i.e. unpaid family helper); or
- (iii) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the survey week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the survey week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or
- (iv) were employers or self-employed persons who had a job, business or farm, but were not at work.

Unemployed persons are those aged 15 years and over who were not employed during the survey week, and:

- (i) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the survey week, and
 - (a) were available for work in the survey week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the survey week); or
 - (b) were waiting to start a new job within four weeks from the end of the survey week and would have started in the survey week if the job had been available then; or
- (ii) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the survey week (including the whole of the survey week) for reasons other than bad weather or plant breakdown.

Actively looking for work includes writing, telephoning or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service noticeboards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency, advertising or tendering for work; and contacting friends or relatives. In November 1981 a number of minor amendments were made to the labour force survey questionnaire. (For details please refer to Information Paper : Questionnaires used in the Labour Force Survey, December 1981 (Catalogue No. 6232.0)). The amendments included a re-ordering and some re-wording of the categories of steps taken to find work.

The unemployment rate for any group is the number unemployed expressed as a percentage of the labour force (i.e. employed plus unemployed) in the same group.

Duration of unemployment is the period from the time the person began looking for work or was laid off to the end of the survey week. Periods of unemployment are recorded in complete weeks and this results in a slight understatement of duration.

Average (mean) duration of unemployment is the duration obtained by dividing the aggregate number of weeks a group has been unemployed by the number of persons in that group.

The labour force comprises all persons who, during the survey week, were employed or unemployed, as defined above.

The labour force participation rate for any group is the labour force expressed as a percentage of the civilian population aged 15 years and over in the same group.

Full-time workers are those who usually work 35 hours a week or more and others who, although usually part-time workers, worked 35 hours or more during the survey week. Part-time workers are those who usually work less than 35 hours a week and who did so during the survey week. When recording hours of work, fractions of an hour are disregarded.

Average hours of work refer to actual hours worked during the survey week, not hours paid for. The figures may be affected by public holidays, leave, absenteeism; temporary absence from work due to sickness, injury, accident and industrial dispute; and stoppages of work due to bad weather, plant breakdown etc. When hours of work are recorded fractions of an hour are disregarded and this results in slightly lower figures than would be the case if actual time worked was recorded. Persons stood down for the whole of the survey week without pay because of bad weather or plant breakdown at their place of employment are regarded as employed and therefore are included (working no hours) in the calculation of average hours worked. Persons stood down in the survey week for reasons other than bad weather and plant breakdown and waiting to be called back to their job are regarded as unemployed and are therefore excluded from the calculation.

Persons not in the labour force are those who, during the survey week, were not in the categories 'employed' or 'unemployed' as defined above. This category includes persons who were keeping house (unpaid), attending an educational institution (school, university etc.), retired, voluntarily inactive, permanently unable to work, inmates of institutions, trainee teachers, members of contemplative religious orders, and persons whose only activity during the survey week was jury service or unpaid voluntary work for a charitable organisation.

CLASSIFICATION OF INDUSTRY AND OCCUPATION

Industry is classified according to the Australian Standard Industrial Classification (ASIC), 1978 Edition and occupation according to the Classification and Classified List of Occupations, Revised June 1976.

REVIEW OF ABS EMPLOYMENT STATISTICS

Publication of the civilian employment series of statistics was suspended after April 1980 because of imperfections. A review of ABS employment statistics, including some aspects of series derived from the Labour Force Survey, was then undertaken. A major outcome of the review is that a new series of employment estimates, based on a survey of private employers and government bodies, will replace the former civilian employees series in about 18 months time. In the meantime, publication of the monthly government employment series has been resumed - see The Labour Force, Australia (Preliminary) (Catalogue No. 6202.0) and The Labour Force, Australia (Catalogue No. 6203.0).

For further details of the review please refer to Information Paper : Review of ABS Employment Statistics (Catalogue No. 6239.0).

RELIABILITY OF THE ESTIMATES

Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them, are subject to sampling variability; that is, they may differ from the figures that would have been produced if all dwellings had been included in the surveys. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included in the surveys. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included in the survey, and about nineteen chances in twenty that the difference will be less than two standard errors.

Another measure of sampling variability is the relative standard error which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling, and thus avoid the need to refer also to the size of the estimate.

Standard errors of estimates and of monthly movements are shown in the tables below. A guide to the standard errors of quarterly movements can be obtained by multiplying the figures in the table of standard errors of monthly movements (Table B) by 1.4. A guide to the standard errors of annual movements can be obtained by multiplying the figures in the table of standard errors of estimates (Table A) by 1.4.

TABLE A - STANDARD ERRORS OF ESTIMATES OF LEVELS, SOUTH AUSTRALIA

Size of Estimate	Standard Error	Relative Standard Error
2 500	510	20.4
3 000	550	18.3
3 500	590	16.9
4 000	620	15.5
4 500	650	14.4
5 000	680	13.6
6 000	730	12.2
10 000	900	9.0
20 000	1 200	6.0
50 000	1 600	3.2
100 000	2 100	2.1
200 000	2 600	1.3
300 000	2 900	1.0
500 000	3 300	0.7
600 000	3 500	0.6

TABLE B - STANDARD ERRORS OF ESTIMATES OF MONTHLY MOVEMENTS, SOUTH AUSTRALIA

Size of Larger Estimate	Standard Error
2 500	490
3 000	520
3 500	540
4 000	570
4 500	590
5 000	610
6 000	650
10 000	760
20 000	930
50 000	1 200
100 000	1 400
200 000	1 700
300 000	1 900
500 000	2 100
600 000	2 200

The smaller the estimate the higher is the relative standard error. Very small estimates are subject to such high relative standard errors as to detract seriously from their value for most reasonable uses. Estimates below 2 500, and percentages based on such estimates, have not been included in this publication. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

Examples of the calculations and use of standard errors are given below:

- (i) From Table A it will be seen that the estimate of 358 000 employed males in February 1982 has a standard error of about 3 000, and therefore there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall within the range 355 000 to 361 000 and about nineteen chances in twenty that the value will fall within the range 352 000 to 364 000.
- (ii) The estimate of movement in the number of employed males from January to February 1982 is an increase of 1 700. Table B relates the standard error of the monthly movement to the larger of the two estimates from which the movement is derived. In this case the February 1982 estimate (358 000) is the larger. From Table B it will be seen that the standard error of the monthly movement is about 1 900. Therefore there are about two chances in three that if all dwellings had been included in the surveys the movement would have been within the range -200 to 3 600 and about nineteen chances in twenty that it would have been within the range -2 100 to 5 500.

The relative standard errors of estimates of average hours worked and average duration of unemployment are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see Table A) and then multiplying the figure so obtained by the following relevant factors:

average hours worked : 0.5
average duration of unemployment : 1.5

Because of these higher relative standard errors, estimates of average duration of unemployment have higher cut-off points for publication than other estimates as shown in Table A.

It must be remembered that there is no justification for saying that the 'true' estimate is more likely to be at any one point in the range than at any other. Further details on sampling variability can be obtained from the Technical Note in The Labour Force, Australia (Catalogue No. 6203.0).
